linkedin.com/in/evgenii-denisov-el71gato | Montenegro, relocate or remote | Employee or B2B

Summary: Developer with 8+ years of backend experience and a strong interest in game design. Understand systems from both the implementation and design side. Shipped gameplay mechanics professionally and prototype game ideas independently.

Technologies: Python, Go, JS, C++, UE, Git, Perforce.

Work experience

- **LimeCity** (Russia, remote): June 2024 – present (part-time, then full-time)
Gameplay Backend Developer (Python, DRF, PostgreSQL, Redis, Celery, Docker)
 - Developing backend for a mobile city builder (~1000 DAU) in a small team.
 - Implemented game economy systems: multi-currency model, referral trees, quest pipeline, daily reward streaks, OTP-confirmed spending.
 - Integrated a Telegram wallet, payment processing, and a parent-platform quest system (quests completed in-app, credited on the platform).
 - Maintaining production infrastructure and handling deployment incidents.
 - **V4Scale** (Israel, remote): November 2023 – September 2024 (part-time)
Python / Go Backend Developer (Python, Go, FastAPI, gRPC, RabbitMQ, NATS)
 - Maintained an information security management system with an international team.
 - Refactored and standardized a shared protobuf repository.
 - **Zubr** (Russia, remote): July 2020 – February 2023
Python Backend Developer (Python, FastAPI, gRPC, Kafka, Redis, RabbitMQ)
 - Maintained a crypto derivatives exchange backend (built to handle high load) with a team.
 - Owned user-facing services: authentication, non-trading operations (crypto deposits/withdrawals, inter-account transfers).
 - Designed and implemented a notification routing service dispatching events to email, push, and SMS microservices.
 - Prevented a critical data-integrity incident (potential loss of several BTC): an out-of-band event mutation left services on divergent state that idempotency correctly refused to overwrite — added cross-service reconciliation so they could recover instead of stalling on conflicting versions.
 - **Home Bank** (Russia): September 2018 – April 2020
Python Backend Developer / ML Specialist (Python, Django, Celery, PostgreSQL, Keras)
 - Maintained an installment goods marketplace with a team.
 - Split a monolith codebase into services and microservices.
 - Replaced an ML-based feed parser with a deterministic solution, reducing processing time from minutes to seconds per feed.
 - Refactored a 200-line legacy SQL query, cutting execution time from 20 to 7 minutes and making it maintainable.
 - Debugged staging and production servers via k8s and Nomad GUI.
 - **Avatarico** (Russia): January 2018 – June 2018
Python Backend Developer / ML Specialist (Python, DRF, NLTK, PyTorch)
 - Sole Python developer and ML specialist in the company. Self-studied both domains and built an entertaining neural network simulating a chat user.
 - **220 Volt** (Russia): December 2015 – October 2017
QA Engineer (Postman, Yandex.Tank, pytest)
 - Wrote autotests with pytest.
 - Adopted and introduced Gitlab CI and Docker before they went mainstream.
-

Open Source

Contributed Python 3 compatibility to Yandex.Tank (load testing tool) (yandex/yandex-tank, [PR #798](#)).

Education

Specialist's Degree in Information Security (Telecommunications) — Southern Federal University (SFedU), 2013. 5.5-year program, equivalent to Master's (EQF Level 7).

Languages

English (B2), Russian (native).
