Location: Montenegro, ready to relocate or to work remotely.

Desired position: Technical Game Designer

Employment: staffer or entrepreneur contract.

Skills: Gameplay prototyping and implementation, Web API.

Technologies: Python, Go, JS, C++, UE, Git, Perforce.

Summary: Developer with 8+ years of backend experience and a strong interest in game design. Understand systems from both the implementation and design side. Shipped gameplay mechanics professionally and prototype game ideas independently.

Work experience (8+ years total)

LimeCity (webgl.limecity.online): June 2024 – now (part-time, then full-time)

Gameplay Backend Developer (Python, DRF, PostgreSQL, Redis, Celery, Docker)

Developing backend for a mobile city builder in a small team. Implemented game economy systems: multi-currency model, referral trees, quest pipeline, daily reward streaks, OTP-confirmed spending. Integrated Telegram wallet and several other third party systems. Administering production servers and maintaining deployment infrastructure.

V4Scale (v4scale.com): November 2023 – September 2024 (10 months, part-time)

Python / Golang Backend Developer (Python, Go, FastAPI, gRPC, RabbitMQ)

Maintained an information security management system with an international team. Refactored and standardized a shared protobuf repository.

Zubr (Saint Petersburg, zubr.io): July 2020 – February 2023 (2 years 7 months)

Python Backend Developer (Python, FastAPI, gRPC, Kafka, Redis, RabbitMQ)

Maintained a cryptocurrency derivatives exchange backend within a team. Owned user-facing services: accounts, authentication, non-trading operations (crypto deposits/withdrawals, inter-account transfers). Designed and implemented a notification routing service dispatching events to email, push, and SMS microservices. Prevented a critical data integrity incident that could have cost the company several BTC by modifying multiple services to handle data consistency errors.

HCF Bank (Saint Petersburg, market.homecredit.ru): September 2018 – April 2020 (1 year 8 months)

Python Backend Developer / ML Specialist (Python, Django, Celery, PostgreSQL, Keras)

Maintained an installment goods marketplace with a team. Split a monolith codebase into services and microservices. Replaced an ML-based feed parser with a deterministic solution, reducing processing time from minutes to seconds per feed. Refactored a 200-line legacy SQL query, cutting execution time from 20 to 7 minutes and making it maintainable.

Avatarico (Saint Petersburg, avatarico.com): January 2018 – June 2018 (6 months)

Python Backend Developer / ML Specialist (Python, DRF, NLTK, PyTorch)

Sole Python developer and ML specialist in the company. Self-studied both domains and built an entertaining neural network simulating a chat user.

220 Volt (Saint Petersburg, www.220-volt.ru): December 2015 – October 2017 (1 year 10 months)

QA Engineer (Postman, Yandex.Tank, pytest)

Both checked new functionality and made proposals about adding, removing and modifying the product features. Wrote autotests with pytest. Adopted and introduced Gitlab CI and Docker before they went mainstream.

Education

Higher (2013): SFedU, Information Security Faculty, Telecom Information Security.

Open Source

Contributed Python 3 compatibility to Yandex.Tank (load testing tool) ([yandex/yandex-tank](https://github.com/yandex/yandex-tank), [PR #798](https://github.com/yandex/yandex-tank/pull/798)).
